

Fiber Optic Cable Temperature Cycling Test

Overview

Fibre attenuation is measured at temperature extremes and after return to ambient. The test reveals thermal expansion mismatches between cable elements that cause micro-bending losses. A minimum of 10 complete cycles is standard. This test assesses the attenuation behaviour of a cable under a no-end movement. UNIVER TCC-1000 and TCC-2000 Series Temperature Cycling Chambers are specially designed to perform temperature cycling tests on optical fiber cables, evaluating the stability of optical attenuation under varying temperature conditions. These chambers feature a large-capacity test space, precise. IEC 60794 is the international standard series governing the design, construction, and performance verification of fibre optic cables. Published by the International Electrotechnical Commission, it defines the mechanical, environmental, and optical tests that every cable must pass before it can be. The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.
