

Network Rack Raise Bracket

Article Overview

A network rack raise bracket is a hardware accessory used to elevate and stabilize server or network equipment racks on raised floors, improving accessibility, weight distribution, and seismic resilience.

Purpose and Function

Network rack raise brackets are designed to secure racks to raised floor structures, typically ranging from 4 to 36 inches in height, ensuring stability and preventing tipping or movement during maintenance or seismic events . They are particularly useful in data centers where racks must be anchored above cable trays, cooling systems, or other underfloor infrastructure . These brackets can also serve as rack extenders, allowing equipment of varying depths to fit properly within standard 19-inch or 23-inch racks, improving cable management and airflow . Some brackets provide additional weight support for heavy equipment mounted on the front rails, while reducer brackets offer versatility for racks of different widths .

Installation Considerations

- **Raised Floor Preparation:** Before installing a raise bracket, the raised floor must be prepared with cutouts for cables and anchor points. Eyebolts or anchor bolts are installed into the concrete subfloor to secure the rack .
- **Bracket Attachment:** The bracket is typically attached to the rack frame and anchored to the floor using turnbuckles, threaded rods, or stabilizer bars. Adjustable components allow the bracket to accommodate different floor heights and rack positions .
