

Standard Modular Cold Aisle Cabinets

Overview

A Modular Cold Aisle Cabinet is a specialized server cabinet designed for modern data centers. It is installed within the cold aisle and separated from the hot aisle, creating a highly efficient airflow system that directs cool air directly to server intakes while preventing hot air. Data centers opting for cold containment deliver cold air through a raised floor into the aisle. This air is contained in front of the cabinets, creating a homogeneous air plenum at the desired temperature. A cabinet supported cold aisle containment solution consists of aisle-end. The aisle containment system is a modular rowbased thermal containment solution, which separates cold and hot data center air streams to and from equipment. It manages airflow at the source, increases the cooling efficiency and significantly lowers down operating costs.
